

AP CSP | Chapter 2: From Data to Evidence

Part A | Ask a question and inspect the data

Name: _____ Partner: _____ Date: _____

Dataset: 16 raw fictional responses from a voluntary school commute survey on one morning. Fields: response ID, main mode, one-way minutes and one-way distance in kilometres.

1. Write a question this dataset can help answer. Identify the records you need.

2. Identify two pieces of metadata and explain why each matters for this question.

3. Inspect the raw records. Record three quality issues and justify your decisions.

Response / field	Issue	Action and reason

4. Record the original row count, cleaned count, and any mode filter used.

5. Explain how you handle the 120-minute observation. Why is an unusual value not necessarily wrong?

AP CSP | Chapter 2: From Data to Evidence

Part B | Analyse, evaluate and communicate

6. Record summary statistics. Label the subset and keep the units clear.

Subset / mode	n	Mean (min)	Median (min)
All cleaned			
Selected mode: _____			
Same subset, omit 120			

7. Sketch a suitable chart or attach the lab chart. Give a title, axis labels, units and an honest scale.

8. State a claim supported by two numerical observations. Say which records your claim describes.

9. Give a limitation. Explain why a travel-time difference alone does not prove that transport mode caused it.

10. Propose a useful next investigation and the additional data it would need.
