

AP CSP | Create Classroom Guide

Planning | Protect the task time; teach and rehearse beforehand

This chapter schedules six 90-minute work sessions: 540 minutes (9 hours). The sequence is a local planning choice, not a prescribed College Board pacing guide.

Before the formal task begins

Teach the directions, collaboration and AI rules. Rehearse PDF export, recording, cropping and form navigation using practice material. Confirm platform access, exam registration, devices and accessibility arrangements. Keep these lessons separate from the nine dedicated hours.

Session	Student-directed focus	Dedicated time
C01	Choose & Begin	90 minutes
C02	Build Data & Functionality	90 minutes
C03	Develop & Integrate	90 minutes
C04	Test & Refine	90 minutes
C05	Create Your Video & PPR	90 minutes
C06	Check & Submit	90 minutes

During the dedicated work sessions

Allow students to decide the project and implementation. Shift work between sessions as progress requires. Formal task work may include planning, development, testing and preparing the three components. Provide extra classroom time when needed; make up interruptions and breaks.

The private journal separates actual classroom and outside-class minutes. Its totals are planning records, not a compliance certificate or a score. Do not count ordinary instruction or exam revision as dedicated Create time.

Program development may follow the permitted collaboration rules. Students must create their own videos and select/create their own PPR independently. Do not publicly share formal student work.

AP CSP | Create Classroom Guide

Support boundaries | Use the full official directions when a case is uncertain

Appropriate teacher support during the formal task

Clarify written directions and submission procedures; organize groups and resolve collaboration conflicts; address technical barriers such as equipment, connectivity and file transfer. Check readability, file format and prohibited PPR comments without providing content-quality feedback.

Keep ownership with the student

Do not choose the project, design or write the formal program, debug or test it for the student, revise the submission, select PPR code, or provide pre-final scoring/quality feedback. A completed practice or curriculum example is not a formal task submission.

AI and outside resources

Current policy permits supplementary AI help with concepts, code development and debugging. Students must actively develop the required work, understand and check code, and acknowledge external assistance. Citation alone does not establish active development. Do not invent an AI percentage limit or ban every AI-assisted fragment from the PPR.

Written-response practice and feedback

Students may independently self-test with sample written-response prompts before final submission. Teacher feedback on the formal work and teacher-led written-response practice using it come after all three components are finalized. Schedule that instruction outside the nine-hour block.

Final submission and limited returns

Students finalize all three components separately. Monitor official status and resolve missing/technical submissions before the deadline. A limited return may address an incorrect, corrupt or unreadable file or prohibited PPR comments/course content; it is not a chance to improve a low-quality response. The student must finalize again before the deadline.

2027 milestones

Create deadline: 30 April 2027, 11:59 p.m. Eastern Time. AP CSP exam: 14 May 2027, Session 1. Recheck the current official schedule and directions before administering the task. Students outside a traditional class should consult the school-based AP coordinator.
